

Interactive mode 1

- ▷ Should be in Stand-by until user steps on tile
- ▷ Should disappear widget elements & display weight
- ▷ Should show users Health info upon stepping
- ▷ 3 display classes:
standing-by, weighing/detecting user,
Display user info

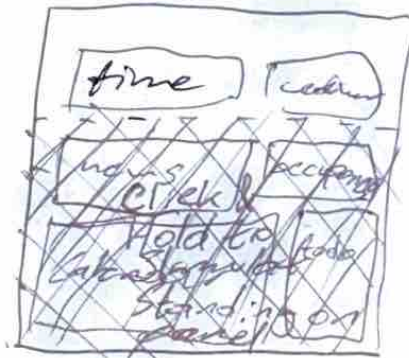

How do we show this
through the web ui

I will demonstrate this
by having the outline
that the user in the web ui
should click & hold

standby default

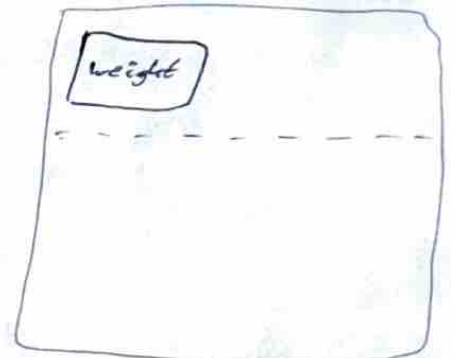

Interactive 1

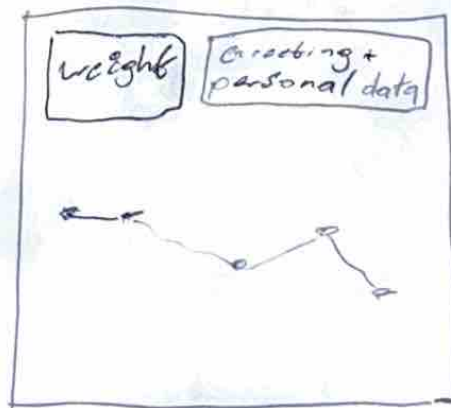

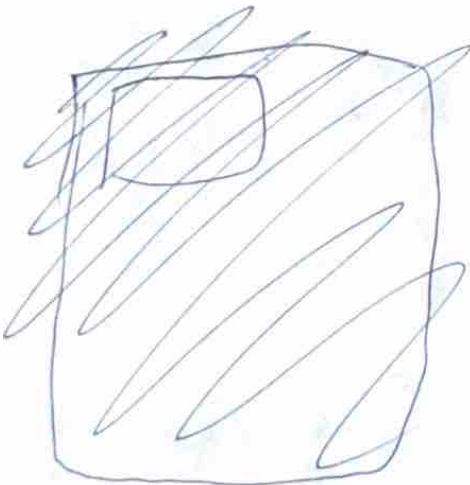

"click & hold to
simulate standing
on the panel"

Interactive 1
"while holding down"

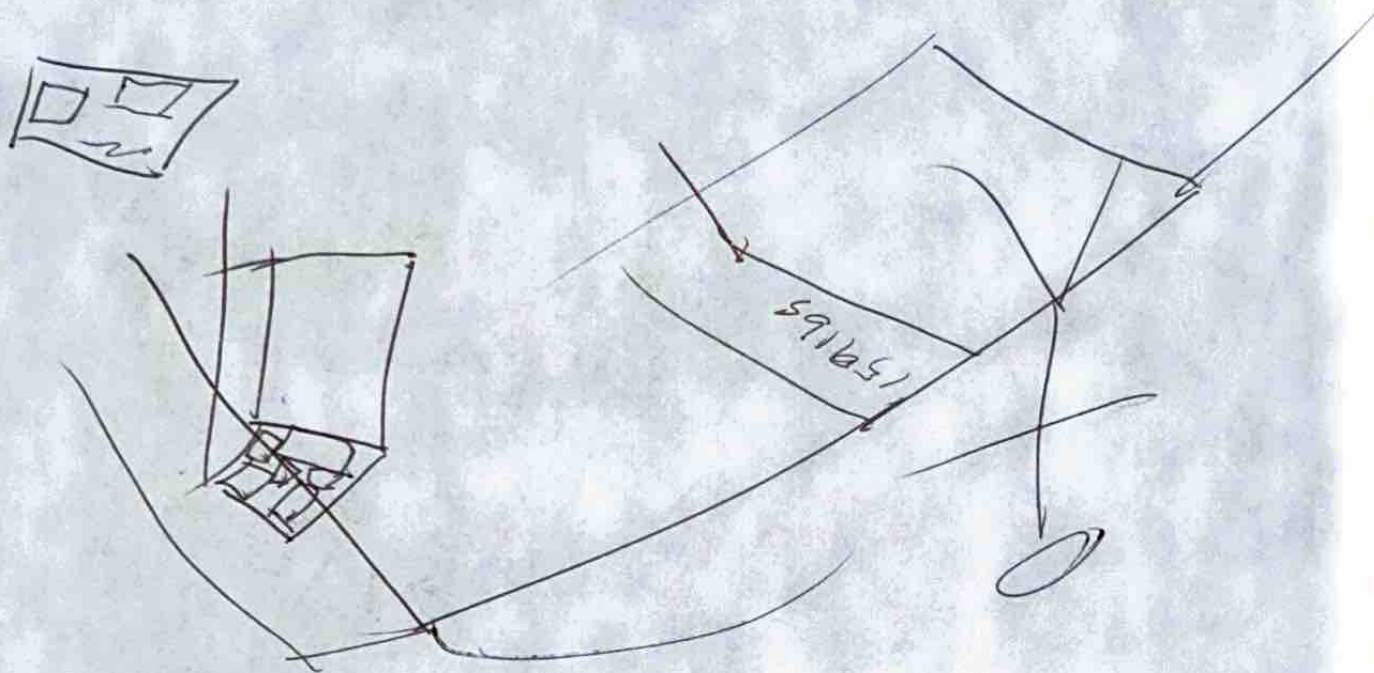

user holds for
3 seconds
during which
this is what
they see...

It's a by all appearances
a screen on the floor with
a lever beside it.

However when flipped the

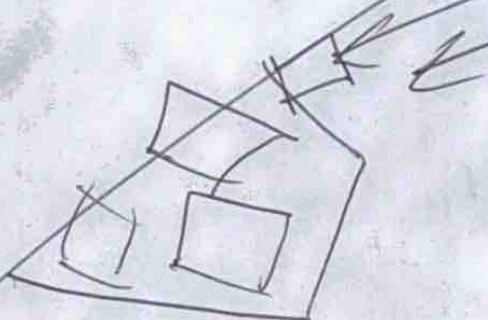

lever transforms the device
into an "extractable tablet".

Sunday			

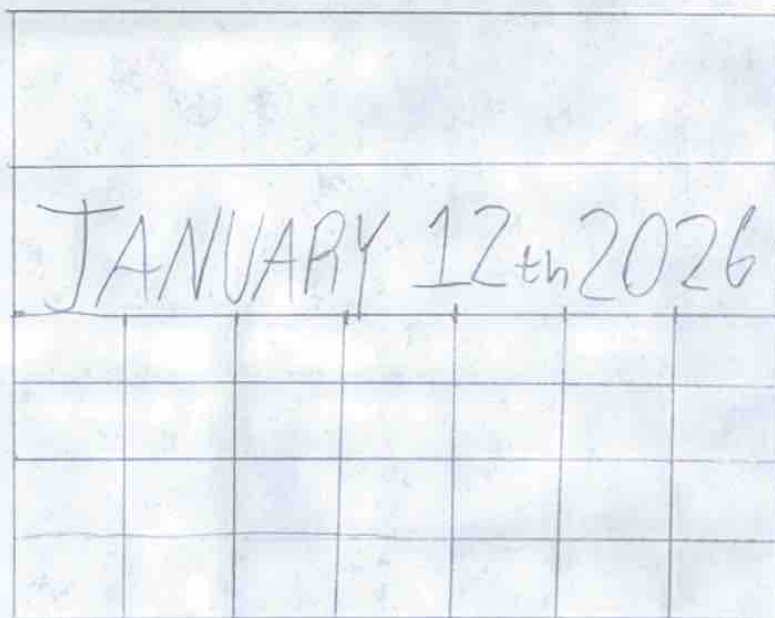

← put date above calendar

- Shrink Calendar
- Include outside temp
- Include tasks
- Remove family information?

Interactive mode 1/2

Interactive mode 2/2

Functions

- Add Activities or tasks
- Change size & positions of widgets

The Smart floor tile isn't just a static Tablet but is the center piece of whatever room the use decides to put it in.

Through a mechanical lever beside the tile the user can step on & access the interactive mode 2 & revealing hidden storage beneath the device.

How to Simulate

Simulating the devices functionality is fairly straight forward.

~~The functionalities~~

Each of which

The device has 3 modes, ~~2 of which~~ have separate pages at the top of the nav. Stand-by mode has ~~&~~ no user interactions. Interactive mode 1 has a semi transparent overlay which the user must select the person they would like to simulate

Carter Smith

Project 01 - Smartfloortile

The smart floor tile is a device that allows families to keep track of ambient information as well as their personal health information.

This is done through 3 distinct modes a stand-by mode allowing the user to observe ambient info such as Time, Weather, or news from an RSS FEED.

~~#~~ Interactive mode 1 which becomes active once a user stands on the device & displays their health info & Interactive mode 2 which allows the user to customize & resize the widgets on display.

Simulation

Stand by - mode

- ▷ no user interactions
- ▷ contains occupancy widget which periodically goes up and down to simulate people entering & exiting the home

Interactive 1 - mode

- ▷ Simulates user stepping on the device to check their health info
- ▷ There are 4 users to choose from "Sarah, Austin, Emma, Marcus"
click & hold the text for 3+ seconds to simulate the user walking onto the device checking their weight.
Then release the button simulating the user stepping off which displays their full health statistics

InteractiveZ - mode

- ▷ This mode simulates what the device configuration options will look like when the tile ascends from the ground or from the users companion application
- ▷ The widgets can be selected where they will be highlighted blue where the user can drag & resize the widgets to fit the 8x8 grid. The widgets can also be deleted by clicking the red  in the top right.

Theres a widget "Todo" which the user can change entries on from this mode.

+ Add/Remove tiles

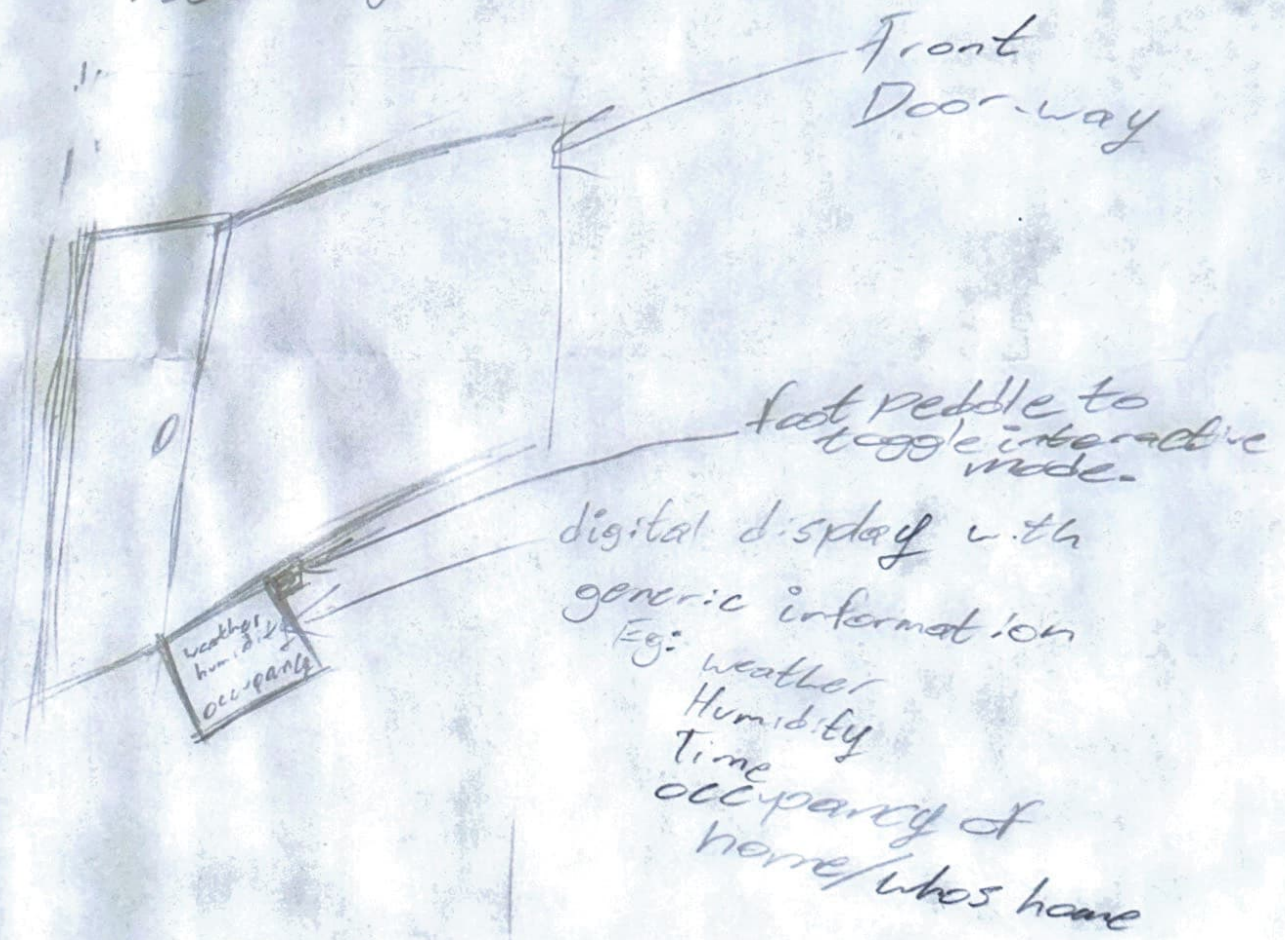

Carters Smart Floor Sketch

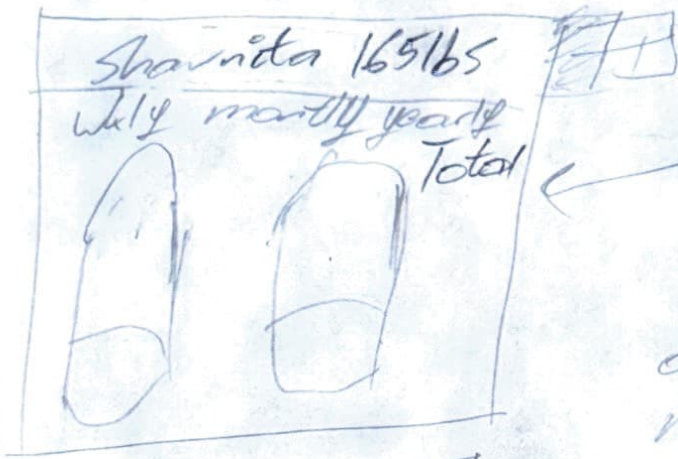

Controls:

↳ Heated floors

↳ weight

↳ security

standing on
panel

allows user to
check their weight

Where the panel
display the users name
maybe notes/calendar
info added from interactive
mode + additional health
info.

(This information is gathered
via the floor detecting user
weight/age/schedule into
automatically & this just the
dashboard & you don't need
to stare at the screen
to collect this info it
just does it via the rest
of floor tiles

Upon activating the lever for interactive mode
the assembly sinks slightly to give the user a
audio signal to step off & when the user does
the assembly will rise from the floor revealing
hidden storage & change modes from creative
information to a terminal to control their smart
floor from & to adjust design elements on the
display
